

AETHERVAULT : ONE-PAGER EXECUTIVE SUMMARY

Building the Permanent Memory Layer and Digital Legacy Protocol on Web3

The Vision

AetherVault is an end-to-end cryptographic infrastructure built natively on the BNB Chain to secure digital assets, intellectual property, and frictionless token creation. We solve the crisis of data permanence and digital inheritance through a fully trustless, zero-knowledge decentralized protocol.

The Problems We Solve

- Fragility of Digital Inheritance: Billions of dollars in crypto assets are lost annually because owners pass away without bequeathing private keys.
- Lack of Universal IP Proof: Creators struggle to prove the absolute authenticity and ownership of digital works without relying on centralized intermediaries.
- Spam & Scam Token Proliferation: Frictionless token creation is frequently exploited for low-effort spam and rug-pull operations.

Core Ecosystem Architecture

- Aether Capsule & Legacy Vault: Time-locked, 100% client-side ECIES-encrypted vaults equipped with an automated "Dead-Man's Switch" for trustless inheritance.
- Aether Proof™: An immutable on-chain intellectual property registry and mathematical ownership verification engine utilizing Keccak256 hashes.
- AetherForge: An anti-spam decentralized token factory featuring automated fee routing to the DAO Treasury, Staking rewards, and deflationary burn mechanisms.

Security, Validation & BNB Chain Synergy

- Industrial-Grade Verification: Validated through a hybrid toolchain (Hardhat + Foundry), passing Slither static analysis and 128,000+ state-transition invariant/fuzzing runs with a 100% success rate.
- BNB Chain Optimized: Engineered for minimal execution overhead and high-frequency "Proof of Life" state updates, leveraging sub-cent gas efficiency and ultra-low latency.

Grant Request: \$30,000 (Phase 1 Mainnet Catalyst)

We operate under a lean, high-efficiency development model—having independently delivered 90% of the core architecture. This Phase 1 grant is strictly allocated toward institutional-grade security and ecosystem launch:

- Security & Smart Contract Audit (40% | \$12,000): Independent third-party security audits prior to public launch.
- Infrastructure & DevOps (30% | \$9,000): Dedicated RPC nodes, production Arweave integration, and deployment overhead.
- Marketing & Bug Bounty (20% | \$6,000): Early adopter acquisition campaigns and white-hat penetration incentives.
- Initial Liquidity Provision (10% | \$3,000): Initial protocol-owned liquidity pairing (\$AETH) on decentralized exchanges.
